POLAND/Chemical Technology. Chemical Products
and Their Application--Synthetic fibers. I-26

Abs Jour: Ref Zhur-Khimiya, No 3, 1957, 10076

Abstract: creation of natural raw materials like cellulose to which they apply the term "artificial" and truly man-made fibers like dacron and nylon which they call "synthetic". The 1955-1961 five-year plan provides for a 70% increase in the production of polyamide fibers (i.e. nylon), a 230% increase in the production of polycrylonitrile fibers, a 30% increase in the production of rayon, a 50% increase in the production of staple fibers, and an 80% increase in the production of protein fibers.

The determination of small quantities of water in solid organic substances. W. Szwietłowski and S. Migrnik. Bull. intern. Acad. polonaise, Classe sci. math., nat. 1935A, p. 8. An improved universal ebulliometer (C. A. 25, 266) with one dephlegmator is described. When an absolutely anhyd. solid, such as PhCO₂H, is added to an azeotropic mixt. of C₂H₆ and EtOH in the ebulliometer the temp. of condensation, *t*, at the top of the dephlegmator is not affected. However, if there is any H₂O in the solid, *t* will drop. The procedure is to det. *t* for the azeotropic mixt., add a known wt. of solid, det. *t* again, and then add known wts. of H₂O dissolved in C₂H₆ and EtOH, det. *t* each time. At per mg. H₂O can now be calcd. and from the drop in *t* when the solid was added the percentage of H₂O in the solid is calcd. By using over 15 g. of solid as little as 0.001% H₂O can be detected. Some results were: com. PhCO₂H, 0.10% H₂O; PhCO₂H, Merck, for calorimetry, 0.010%; same, dried over P₂O₅, 0.003%; same, heated to b. p. *in vacuo*, 0.002%; com. salicylic acid, 0.036%. John R. Millerv

✓ Miernik E. Methods of Testing the Wear on an Internal Combustion Engine.

"Metody badania zużycia silnika spalinowego". Przegląd Mechaniki, No. 4, 1953, pp. 155—159, 9 figs.

A modern internal combustion engine in its present form is characterized by a high load on individual elements which, among other things, causes them to wear. The author discusses several methods and installations for measuring the wear of parts of an internal combustion engine — in the first place the elements which are most exposed to wear, i.e. cylinder liners and piston rings. The description of the installation includes the scope of its applicability and the accuracy of measurement.

Illus. 6

For 4 yr. the authors have abstained from treating keloids locally, as it was observed that regression was obtained after periodical administration of large doses of the vitamins C, PP and B₂, as well as of iron. The success obtained in the treatment of keloids also encouraged them to apply this therapeutic method in scleroderma. A very pronounced improvement of the general state of health and the skin following this treatment shows that, even in a chronic disease and as difficult to cure as scleroderma, the results obtained by this method are satisfactory. The observations reported here confirm Pautrier's opinion concerning the possibility of a common cause lying at the root of these 2 collagen diseases.

Treatment of keloids in the light of personal clinical
experience POL.TYG.LEK. 1956, 11/22 (972-977) Illus. 9

According to a modified Terreira-Marquesa method, the patients received periodically big doses of vitamins (PP, B₂, C) and iron. This treatment leads to the disappearance of keloids and excludes the necessity of local therapy. The method proved to be harmless. It has a prophylactic effect, may be applied in ambulatory treatment and yields very good cosmetic results. (IX, 13)

Synthetic lubricants for gas turbines

tures. The maximum temperature at the bearings is attained 30/40 min after the stopping of the engine (circulation of the lubricant and air-flow being stopped, too) and one can foresee that in a short future these temperatures will climb up to 500°C. The problem of turboprops will always be the most difficult, temperatures and pressures being especially high in the transmission gear. The author then studies the possibilities of synthetic lubricants, and gives the following classification: 1) Diesters (esters of mono- or polyhydric alcohols and dicarboxylic acid); 2) Esters of primary alcohols and carboxylic acid; 3) Esters of silicic acid; 4) Silicon polymers; 5) Polyalkylene glycols; 6) Phosphoro-organic fluids, such as esters of phosphoric or phosphorous acids; 7) Fluoro- and chlorohydrocarbons and esters. Each of them presents drawbacks (between others the high cost price). For gas turbines, the most interesting are the diesters. The esters have a relatively high pouring point and an unfavorable viscosity/temperature ratio. The silicon polymers present poor lubrication, and do not stand high pressures at the bearings. They have also a tendency to form gels. The phosphoro-organic- and the chloro-lubricants are good, but their pouring point is too high, and their viscosity/temperature ratio bad. The research for lubricants fit for temperatures above 300°C will probably bring up the study of other

AUTHOR: Mielnikova, Bolesława, Doctor, Master of Engineering

TITLE: Synthetic lubricants for gas turbines

PERIODICAL: Technika Lotnicza, no. 2, 1963, 37 - 42

TEXT: The author considers the requirements exacted for the lubrication of jet engines, especially for military aviation - viscosity, resistance to oxidation and to high temperatures, and fluidity at low temperatures. First he quotes the American lubricants type 1010 (low viscosity at high temperatures, too great volatility, lack of resistance to high pressures) and type 1100 (better, but the pouring point is only 15°C). It can be used for turbojets, because the mixing of a volatile fuel with the lubricant fluidifies it enough for the start, but not for turboprops. The author remarks that the antioxidant additives do not stand temperatures above 200°C. The additives lowering the pouring point do not match with heavy lubricants, as 1100 or MS-200. The viscosity additives cannot be employed with 1010, since they diminish other qualities of this lubricant. Additives characterized by a polar activity are corrosive at high tempera-

| Orig Pub. | : | Prace Inst Lotn, No 5, 28-41 (1957) | |
| Abstract | : | The authors have tested paints and enamels based on oils and on synthetic resins for hardening properties, elasticity at temperatures down to -50°, impact resistance, and resistance to water and gasoline. The water resistance of the coatings was measured by the hardness and adhesion of the films after immersion in water for 3, 6, and 18 hrs following 48-hrs and (in a separate series of tests) and 2-wk drying in air. The coatings were applied to pure aluminum and anode-oxidized aluminum panels. The results from the tests are summarized in tables and illustrated graphically. | |

AUTHOR: Mielnik, Boleslaw, Docent, Master of Engineering

TITLE: Current problems in the field of fuels for turbine jet engines

PERIODICAL: Technika Lotnicza, no. 1, 1963, 2-7

TEXT: The present article is a review, based on Soviet and Western work. The physical and chemical characteristics of Russian (T-1, TS-1, T-2, T-5), Polish (P-2, P-3) and American (JP-1, JP-3, JP-4, JP-5, JP-6) fuels are tabulated and compared. Special attention is paid to the contents of volatile components, tendency towards electrification, the effects of sulfur and mercaptans in the fuels on the corrosive properties, and thermal stability. Conclusions: production of an ideal fuel is not at present very probable owing to the possibility undesirable side effects of various otherwise advantageous components. Chemical composition of the fuels is of leading importance. There are 4 figures and 10 tables.

TITLE: Single channel pulse height analyzer

SOURCE: Nukleonika, v. 10, no. 9-10, 1965, 635-636

TOPIC TAGS: pulse height analyzer, electronic circuit, electronic test equipment

ABSTRACT: The circuit can operate as either a single-channel analyzer or as a direct pulse-height discriminator. It is based on a design found in the literature, but with a number of modifications which give it the following characteristics: an amplitude range of 5-124 v., a measuring dead time of 0.8 μ sec, a 1% nonlinearity, and a stability of 0.2% \pm 70 mv per 8 hours. TITLE: Universal counter assembly

SOURCE: Nukleonika, v. 10, no. 2, 1965, 132-134

TOPIC TAGS: gamma spectroscopy, radiation counter, pulse signal

ABSTRACT: This communication describes a device designed for work with a "fast-slow" system and a time-to-amplitude converter in gamma-rays spectroscopy. It is adaptable to over ten different electron counter assemblies at arbitrarily selected counting capacities. The entire device consists of 70 elementary decades. The incoming pulses are positively polarized, the sensitivity to input pulses is about 4 V, the amplitude of output pulses is about 7 V for the fast decades and about 15 V for the slow decades. Content of Coals from the Zielonka District and the Composition of the Anthracite. Qualitative Index of a Grade of Seam. Effect of the Composite Prace Glebow Inst Gorn., R, no 29, (1957) | |
| ARTICLE, PAPER | Data on coking for the chemical composition of the sed. (14) various sediments of coals from the Gliwicki district (Polish People's Republic), taken from three levels. On the basis of an analysis of these data, the possibility of the utilization of the coal as a characteristic index for groups of coal seams in which different sedimentation condi- tions prevail, is indicated. The effect of the it on the coking properties of the coal is also discussed, and the increased thickness of the coking properties of the coal. | |

Abstract : The parameters characterizing coal are divided into two groups in the discussed draft : 1/ the fundamental - the combustion heat of the working fuel in kcal per kg (the lowest limit is given for each of the 9 classes of coal), ash content of the working fuel in % (the highest permissible limit is given); 2/ the orientation parameters - total moisture in %, content of inert materials (ash and total moisture) in %; moisture of coal dried in air at
